FAST FACTS FOR ORAL SURGERY

Indicated for Administration Into the Surgical Site to Produce Postsurgical Analgesia

• EXPAREL provides long-lasting pain control that reduces opioid requirements*
• Indication supports broad use across surgical procedures and is available for oral surgery when administered as local infiltration
• Cutting-edge DepoFoam® technology delivers bupivacaine over time to extend pharmacologic effect¹
  — Encapsulates bupivacaine via a multivesicular liposomal drug delivery technology and releases over time as lipid membranes reorganize¹

Dosing and Preparation

• EXPAREL is intended for single-dose administration only and is available as a 20 mL single-use vial (1.3%, 266 mg/20 mL) and a 10 mL single-use vial (1.3%, 133 mg/10 mL)
• The recommended dose of EXPAREL is based on the following factors:
  — Size of the surgical site
  — Volume required to cover the area
  — Individual patient factors that may impact the safety of an amide local anesthetic
  — Maximum dose should not exceed 266 mg (one 20 mL vial)
• Volume can be expanded to accommodate larger surgical sites
  — A 20 mL vial of EXPAREL can be administered undiluted or expanded up to a total of 300 mL with normal (0.9%) saline or lactated Ringer’s solution
• Bupivacaine HCl may be administered immediately before EXPAREL or admixed in the same syringe, as long as the ratio of the milligram dose of bupivacaine HCl to EXPAREL does not exceed 1:2
  — Admixing may impact the pharmacokinetic and/or physiochemical properties of EXPAREL, and this effect is concentration dependent
  — The toxic effects of these drugs are additive and their administration should be used with caution, including monitoring for neurological and cardiovascular effects related to toxicity
• Vials of EXPAREL should be inverted multiple times to resuspend the particles immediately prior to withdrawal from the vial

Dosing Example

• As general guidance in selecting the proper dosing for the planned oral surgery procedure, one example comes from a study in patients undergoing third molar extraction²:
  — In patients scheduled to undergo bilateral third molar extractions (ie, extraction of all four third molars) under local anesthesia, 10 mL of EXPAREL (undiluted) was prepared for infiltration
  — In the maxilla, 2 mL of EXPAREL was infiltrated into each surgical site (right and left), for a total of 4 mL
  — In the mandible, 3 mL of EXPAREL was infiltrated into each surgical site (right and left), for a total of 6 mL

Please see Important Safety Information on reverse and see accompanying full Prescribing Information.

*The clinical benefit of the decrease in opioid consumption was not demonstrated in the clinical trials.
**Administration**

- EXPAREL should be injected slowly into soft tissues of the surgical site using a deep tissue infiltration technique with frequent aspiration to check for blood and minimize the risk of intravascular injection
  - Administer with a 25-gauge or larger-bore needle
- Use a series of injections to effectively cover the surgical area
  - EXPAREL does not diffuse throughout tissues in the same manner as bupivacaine

**Compatibility Considerations**

- Wait 20 minutes after administration of other non-bupivacaine–based local anesthetics before administering EXPAREL into the same surgical site
- Allow topical antiseptics to dry before administering EXPAREL into the same surgical site
- Other than bupivacaine, EXPAREL should not be admixed with other drugs prior to administration

**Storage and Handling**

- EXPAREL vials should be stored refrigerated between 2°C to 8°C (36°F to 46°F)
- EXPAREL may be held at a controlled room temperature of 20°C to 25°C (68°F to 77°F) for up to 30 days in sealed, intact (unopened) vials. Vials should not be re-refrigerated
- EXPAREL should not be frozen or exposed to high temperatures (greater than 40°C or 104°F) for an extended period
- Do not administer EXPAREL if it is suspected of having been frozen or exposed to high temperatures. Vials should be visually inspected before use. Do not use the vial if the stopper is bulging
- Open vials of EXPAREL should be used within 4 hours

**Important Safety Information**

EXPAREL is contraindicated in obstetrical paracervical block anesthesia.

EXPAREL has not been studied for use in patients younger than 18 years of age.

Non-bupivacaine-based local anesthetics, including lidocaine, may cause an immediate release of bupivacaine from EXPAREL if administered together locally. The administration of EXPAREL may follow the administration of lidocaine after a delay of 20 minutes or more. Formulations of bupivacaine other than EXPAREL should not be administered within 96 hours following administration of EXPAREL.

Monitoring of cardiovascular and neurological status as well as vital signs should be performed during and after injection of EXPAREL as with other local anesthetic products.

Because amide-type local anesthetics, such as bupivacaine, are metabolized by the liver, EXPAREL should be used cautiously in patients with hepatic disease. Patients with severe hepatic disease, because of their inability to metabolize local anesthetics normally, are at a greater risk of developing toxic plasma concentrations.

In clinical trials, the most common adverse reactions (incidence ≥10%) following EXPAREL administration were nausea, constipation, and vomiting.

**Please see accompanying full Prescribing Information.**
